

*Focal length

*Optical center

*Radial
distortion coeff

*Initialcalibration would be via OpenCV or LiFCal

*Healthscore is based on reprojectionerror, paremeter drift
or a Feature-based check could be an option

```
classDiagram
    class ResultLogger {
        - runId: string
        - level: string (Debug, info...)
        - basePath: string
        + logCalibrationRun(state: CalibrationState): void
        + logHealthScore(score: int, t: Date): void
        + logParamChange(old: CalibrationState, new: CalibrationState): void
        + flush(): void (Schreibt Log in Datei)
    }
